

Keeping your chute together since 1999

Ultraviolet light odour technology is ideal for building garbage rooms that struggle with strong and lingering odours. Bacteria, viruses and mold are sterilized by germicidal UVC while odours and chemicals are treated by UVV photolysis. The process circulates clean air while destroying odours.

Standard features include

- High intensity UVC & UVV bulb odour elimination
- CSA approved
- Durable steel casing
- Consistently filters “dirty” garbage room air using a 250 cfm German-made impeller blower”.
- Destroys chemical and biological odours
- Supported by one (1) year manufacturer’s warranty

Benefits

- Replaces problematic spray systems, including blocked nozzles
- Eliminates staff inhaling spray-type chemicals
- No spray in the room which rusts away compactors and bins

Neutralizes harmful bacteria and bad odours
